

sub
A8

3 (The overlay image processing device comprises: an image selector for
selecting from among an m number of image signals one reference image
signal and $(n-1)$ number of superimposing image signals, where m is an
5 integer greater than 2; a resolution converter for converting resolutions of
the n number of selected image signals including the reference image signal
and the $(n-1)$ number of superimposing image signals into respective desired
resolutions; and an image synthesizer for superimposing the $(n-1)$ number of
converted superimposing image signals on the converted reference signal.

Questions are asked at each of the four points in time and are identical.
